Background	The protein encoded by this gene is an adaptor molecule that interacts with various cell surface receptors and mediates cell apoptotic signals. Through its C-terminal death domain, this protein can be recruited by TNFRSF6/Fas-receptor, tumor necrosis factor receptor, TNFRSF25, and TNFSF10/TRAIL-receptor, and thus it participates in the death signaling initiated by these receptors. Interaction of this protein with the receptors unmasks the N-terminal effector domain of this protein, which allows it to recruit caspase-8, and thereby activate the cysteine protease cascade. Knockout studies in mice also suggest the importance of this protein in early T cell development.

Western blot analysis of lysates from HeLa cells, using Phospho-FADD-S194 Rabbit pAb (P108466) or FADD Rabbit pAb (P106830). HeLa cells were treated by CIP(20uL/400ul) at 37°C for 1 hour. HeLa cells were treated by nocodazole (50 ng/mL) at 37°C for 20 hours.
